**Fall 202X**

The University of Manitoba campuses are located on original lands of Anishinaabeg, Ininew, Anisininew, Dakota and Dene peoples, and on the National Homeland of the Red River Métis. We respect the Treaties that were made on these territories, we acknowledge the harms and mistakes of the past, and we dedicate ourselves to move forward in partnership with Indigenous communities in a spirit of Reconciliation and collaboration.

# Outline

**Similarity and diagonalisation**

**Linear independence/Bases/Dimension**

**A crash course in multivariable calculus**

A stylized illustration of a robot standing in a vast, arid landscape. The robot is positioned on the left side of the frame, facing right. It has a boxy head, a rectangular torso with circular details, and jointed limbs. The ground is a mix of orange and yellow tones, with scattered rocks and a few dead, bleached tree stumps. In the background, a large, leafless tree with a complex, branching structure stands on the right. The sky is a pale, hazy blue, and distant mountains are visible on the horizon. The overall mood is desolate and contemplative.

**Similarity and diagonalisation**

**Linear independence/Bases/Dimension**

**A crash course in multivariable calculus**

# Similarity

## Definition 29 (Similarity)

$A, B \in \mathcal{M}_n$  are **similar** ( $A \sim B$ ) if  $\exists P \in \mathcal{M}_n$  invertible s.t.

$$P^{-1}AP = B$$

## Theorem 30 ( $\sim$ is an equivalence relation)

$A, B, C \in \mathcal{M}_n$ , then

- ▶  $A \sim A$  ( $\sim$  **reflexive**)
- ▶  $A \sim B \implies B \sim A$  ( $\sim$  **symmetric**)
- ▶  $A \sim B$  and  $B \sim C \implies A \sim C$  ( $\sim$  **transitive**)

## Similarity (cont.)

### Theorem 31

$A, B \in \mathcal{M}_n$  with  $A \sim B$ . Then

- ▶  $\det A = \det B$
- ▶  $A$  invertible  $\iff B$  invertible
- ▶  $A$  and  $B$  have the same eigenvalues

# Diagonalisation

## Definition 32 (Diagonalisability)

$A \in \mathcal{M}_n$  is **diagonalisable** if  $\exists D \in \mathcal{M}_n$  diagonal s.t.  $A \sim D$

In other words,  $A \in \mathcal{M}_n$  is diagonalisable if there exists a diagonal matrix  $D \in \mathcal{M}_n$  and a nonsingular matrix  $P \in \mathcal{M}_n$  s.t.  $P^{-1}AP = D$

Could of course write  $PAP^{-1} = D$  since  $P$  invertible, but  $P^{-1}AP$  makes more sense for computations

### Theorem 33

$A \in \mathcal{M}_n$  diagonalisable  $\iff A$  has  $n$  linearly independent eigenvectors

### Corollary 34 (Sufficient condition for diagonalisability)

$A \in \mathcal{M}_n$  has all its eigenvalues distinct  $\implies A$  diagonalisable

For  $P^{-1}AP = D$ : in  $P$ , put the linearly independent eigenvectors as columns and in  $D$ , the corresponding eigenvalues

# Linear combination and span

## Definition 35 (Linear combination)

Let  $V$  be a vector space. A **linear combination** of a set  $\{\mathbf{v}_1, \dots, \mathbf{v}_k\}$  of vectors in  $V$  is a *vector*

$$c_1 \mathbf{v}_1 + \dots + c_k \mathbf{v}_k$$

where  $c_1, \dots, c_k \in \mathbb{F}$

## Definition 36 (Span)

The set of all linear combinations of a set of vectors  $\mathbf{v}_1, \dots, \mathbf{v}_k$  is the **span** of  $\{\mathbf{v}_1, \dots, \mathbf{v}_k\}$ ,

$$\text{span}(\mathbf{v}_1, \dots, \mathbf{v}_k) = \{c_1 \mathbf{v}_1 + \dots + c_k \mathbf{v}_k : c_1, \dots, c_k \in \mathbb{F}\}$$

# Finite/infinite-dimensional vector spaces

## Theorem 37

*The span of a set of vectors in  $V$  is the smallest subspace of  $V$  containing all the vectors in the set*

## Definition 38 (Set of vectors spanning a space)

If  $\text{span}(\mathbf{v}_1, \dots, \mathbf{v}_k) = V$ , we say  $\mathbf{v}_1, \dots, \mathbf{v}_k$  **spans**  $V$

## Definition 39 (Dimension of a vector space)

A vector space  $V$  is **finite-dimensional** if some set of vectors in it spans  $V$ . A vector space  $V$  is **infinite-dimensional** if it is not finite-dimensional

# Linear (in)dependence

## Definition 40 (Linear independence/Linear dependence)

A set  $\{\mathbf{v}_1, \dots, \mathbf{v}_k\}$  of vectors in a vector space  $V$  is **linearly independent** if

$$(c_1 \mathbf{v}_1 + \dots + c_k \mathbf{v}_k = \mathbf{0}) \Leftrightarrow (c_1 = \dots = c_k = 0),$$

where  $c_1, \dots, c_k \in \mathbb{F}$ . A set of vectors is **linearly dependent** if it is not linearly independent.

If linearly dependent, assume w.l.o.g. that  $c_1 \neq 0$ , then

$$\mathbf{v}_1 = -\frac{c_2}{c_1} \mathbf{v}_2 - \dots - \frac{c_k}{c_1} \mathbf{v}_k$$

i.e.,  $\mathbf{v}_1$  is a linear combination of the other vectors in the set

## Theorem 41

*Let  $V$  be a finite-dimensional vector space. Then the **cardinal** (number of elements) of every linearly independent set of vectors is less than or equal to the number of elements in every spanning set of vectors*

E.g., in  $\mathbb{R}^3$ , a set with 4 or more vectors is automatically linearly dependent

# Basis

## Definition 42 (Basis)

Let  $V$  be a vector space. A **basis** of  $V$  is a set of vectors in  $V$  that is both linearly independent and spanning

## Theorem 43 (Criterion for a basis)

*A set  $\{\mathbf{v}_1, \dots, \mathbf{v}_k\}$  of vectors in a vector space  $V$  is a basis of  $V \iff \forall \mathbf{v} \in V, \mathbf{v}$  can be written uniquely in the form*

$$\mathbf{v} = c_1 \mathbf{v}_1 + \dots + c_k \mathbf{v}_k,$$

*where  $c_1, \dots, c_k \in \mathbb{F}$*

## More on bases

### Theorem 44 (Basis of finite-dimensional vector space)

*Every finite-dimensional vector space has a basis*

### Theorem 45

*Any two bases of a finite-dimensional vector space have the same number of vectors*

### Definition 46 (Dimension)

The **dimension**  $\dim V$  of a finite-dimensional vector space  $V$  is the number of vectors in any basis of the vector space

### Theorem 47 (Dimension of a subspace)

*Let  $V$  be a finite-dimensional vector space and  $U \subset V$  be a subspace of  $V$ . Then  $\dim U \leq \dim V$*

# Constructing bases

## Theorem 48

*Let  $V$  be a finite-dimensional vector space. Then every linearly independent set of vectors in  $V$  with  $\dim V$  elements is a basis of  $V$*

## Theorem 49

*Let  $V$  be a finite-dimensional vector space. Then every spanning set of vectors in  $V$  with  $\dim V$  elements is a basis of  $V$*

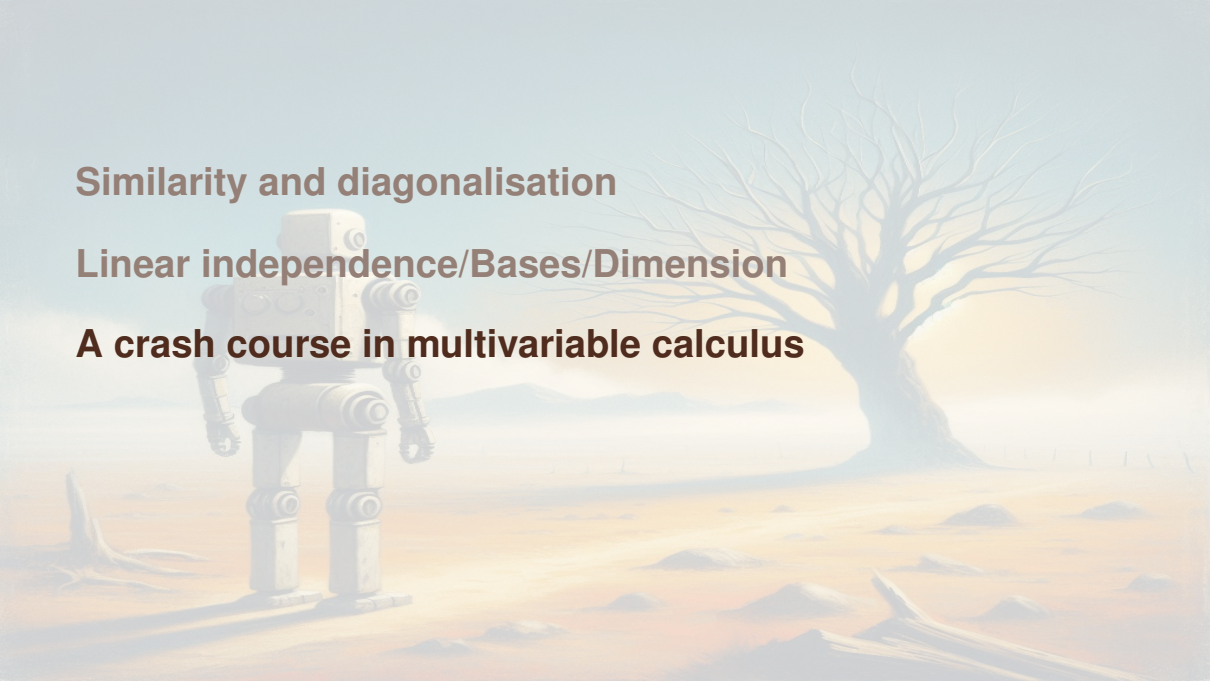

# Linear algebra in a nutshell

## Theorem 50

*Let  $A \in \mathcal{M}_n$ . The following statements are equivalent (TFAE)*

- 1. The matrix  $A$  is invertible*
- 2.  $\forall \mathbf{b} \in \mathbb{F}^n$ ,  $A\mathbf{x} = \mathbf{b}$  has a unique solution ( $\mathbf{x} = A^{-1}\mathbf{b}$ )*
- 3. The only solution to  $A\mathbf{x} = \mathbf{0}$  is the trivial solution  $\mathbf{x} = \mathbf{0}$*
- 4.  $RREF(A) = \mathbb{I}_n$*
- 5. The matrix  $A$  is equal to a product of elementary matrices*
- 6.  $\forall \mathbf{b} \in \mathbb{F}^n$ ,  $A\mathbf{x} = \mathbf{b}$  has a solution*
- 7. There is a matrix  $B \in \mathcal{M}_n$  such that  $AB = \mathbb{I}_n$*
- 8. There is an invertible matrix  $B \in \mathcal{M}_n$  such that  $AB = \mathbb{I}_n$*
- 9.  $\det(A) \neq 0$*
- 10. 0 is not an eigenvalue of  $A$*

A stylized illustration of a robot standing in a desert landscape. The robot is on the left, facing right. It has a boxy head, a rectangular torso with circular details, and jointed limbs. The landscape is a vast, flat, orange-brown desert with small, dark, rocky mounds. In the background, there are rolling hills and a large, leafless tree on the right. The sky is a pale, hazy blue. The overall style is soft and painterly.

**Optimization with Constraints**

**The Lagrangian Method**

**Conclusion**

## One dimension

MATH 1500 & 1700 deal with functions of one variable, like  $f(x) = x^2$

**A 1D function**

# Multivariable calculus

Multivariable calculus extends this to functions of two or more variables, like  
 $f(x, y) = x^2 + y^2$

**A 2D function surface**

# Partial derivatives

How do we measure the “slope” on a 3D surface?

A **partial derivative** measures the slope in a direction parallel to one of the axes

- ▶  $\frac{\partial f}{\partial x}$  measures height change as we move only in the  $x$  direction. Treat  $y$  as a constant
- ▶  $\frac{\partial f}{\partial y}$  measures height change as we move only in the  $y$  direction. Treat  $x$  as a constant

# Partial derivatives

## Slices for Partial Derivatives

# The Steepest path: the gradient

The **gradient**, denoted  $\nabla f$ , is a vector that combines all the partial derivatives:

$$\nabla f(x, y) = \left( \frac{\partial f}{\partial x}, \frac{\partial f}{\partial y} \right)$$

What does it tell us?

- ▶ **Direction:** it points in the direction of the *steepest ascent*
- ▶ **Magnitude:** its length represents the steepness of that ascent

# Follow the gradient

At a peak or a valley (a local max/min), the ground is flat. So,  $\nabla f = (0, 0)$

# **A crash course in multivariable calculus**

A stylized illustration of a robot standing in a vast, arid desert landscape. The robot is positioned on the left side of the frame, facing right. It has a boxy, mechanical design with visible joints and a small head. The ground is sandy and dotted with small rocks. In the background, a large, leafless tree stands prominently on the right, its branches reaching out against a hazy, orange-tinted sky. Distant mountains are visible on the horizon.

**What is Multivariable Calculus?**

**Optimization with Constraints**

**The Lagrangian Method**

**Conclusion**

# The real-world problem

Often, we want to maximize or minimize a function, but we don't have unlimited freedom. We have **constraints**

- ▶ Maximize the profit of your company... *subject to a limited budget*
- ▶ Minimize the material used for a can... *that must hold a specific volume*
- ▶ Find the highest point on a mountain... *while staying on a specific trail*

Setting the gradient to zero ( $\nabla f = 0$ ) finds the highest point on the whole mountain, which might not be on our trail!

# Visualizing the problem

Imagine our function  $f(x, y)$  is the altitude on a map (contour lines)

Our constraint,  $g(x, y) = c$ , is a specific path we must walk on

## Optimization with a Constraint

We are looking for the highest (or lowest) point *along the red path*

## The key insight

At the optimal point on the path, the path will be perfectly **tangent** to the contour line of the surface

**Tangency at the Optimum**

Why? If the path crossed the contour line, you could move along the path to get to a higher (or lower) contour

Mathematically, this tangency means the gradient vectors of the function and the constraint are **parallel**

$$\nabla f = \lambda \nabla g$$

The scalar  $\lambda$  (lambda) is called the **Lagrange multiplier**

# **A crash course in multivariable calculus**

What is Multivariable Calculus?

Optimization with Constraints

**The Lagrangian Method**

Conclusion

# The Lagrangian function

The condition  $\nabla f = \lambda \nabla g$  is clever, but solving it can be messy

Instead, we combine our function and constraint into a single, new function called the **Lagrangian**

$$\mathcal{L}(x, y, \lambda) = f(x, y) - \lambda[g(x, y) - c]$$

- ▶  $f(x, y)$  the function we want to optimize
- ▶  $g(x, y) = c$  the constraint we must follow
- ▶  $\lambda$  the Lagrange multiplier

Finding the unconstrained optimum of  $\mathcal{L}$  solves the original constrained problem!

## The method – step-by-step

To find the optimum of the Lagrangian  $\mathcal{L}(x, y, \lambda)$ , we find where its gradient is zero

We take the partial derivative with respect to *all* its variables ( $x$ ,  $y$ , and  $\lambda$ ) and set them to zero

$$1. \quad \frac{\partial \mathcal{L}}{\partial x} = \frac{\partial f}{\partial x} - \lambda \frac{\partial g}{\partial x} = 0$$

$$2. \quad \frac{\partial \mathcal{L}}{\partial y} = \frac{\partial f}{\partial y} - \lambda \frac{\partial g}{\partial y} = 0$$

$$3. \quad \frac{\partial \mathcal{L}}{\partial \lambda} = -(g(x, y) - c) = 0 \implies g(x, y) = c$$

The first two equations rearrange to  $\nabla f = \lambda \nabla g$  and the third equation is the original constraint

## Example: Fencing a Field

**Problem:** You have 40 meters of fence. What is the largest rectangular area you can enclose?

- ▶ **Maximize Area:**  $A(x, y) = xy$
- ▶ **Constraint (Perimeter):**  $2x + 2y = 40$

### 1. Form the Lagrangian:

$$\mathcal{L}(x, y, \lambda) = xy - \lambda(2x + 2y - 40)$$

### 2. Take Partial Derivatives:

- ▶  $\frac{\partial \mathcal{L}}{\partial x} = y - 2\lambda = 0 \implies y = 2\lambda$
- ▶  $\frac{\partial \mathcal{L}}{\partial y} = x - 2\lambda = 0 \implies x = 2\lambda$
- ▶  $\frac{\partial \mathcal{L}}{\partial \lambda} = -(2x + 2y - 40) = 0$

## Example: Solution

From the first two equations, we see that  $x = y$

Now, substitute this into the third equation (the constraint):

$$2x + 2(x) = 40$$

$$4x = 40$$

$$x = 10$$

Since  $x = y$ , we have  $y = 10$ , i.e., optimal dimensions are 10m by 10m (a square), giving a maximum area of  $100 \text{ m}^2$

# **A crash course in multivariable calculus**

What is Multivariable Calculus?

Optimization with Constraints

The Lagrangian Method

Conclusion

## What does $\lambda$ mean?

The Lagrange multiplier  $\lambda$  has a very useful interpretation

It tells you how much the optimal value of your function  $f$  will change if you slightly relax the constraint  $c$

$$\lambda = \frac{df_{\text{optimal}}}{dc}$$

**In our example:** If we had 41 meters of fence instead of 40 (so  $c$  changes by 1), how much would the max area increase?

$x = y = 2\lambda$ , so  $\lambda = x/2 = 10/2 = 5$ . The maximum area would increase by approximately  $5 \text{ m}^2$
